Description

The wafer manufacturer KARE is one of the most renowned suppliers of baked goods in the Czech Republic. The products are produced, packaged and dispatched from the company's headquarters in Luha#ovice. In order to maintain the highest possible level of production standards, the company initiated extensive refurbishment work at its headquarters in 2020.

Problem

The work carried out included construction of new production and dispatch halls. A hard-wearing floor was installed for reliable protection against the stresses and strains of everyday production. The selected system is characterised by its high mechanical and thermal resistance. The new floor must be able to withstand high mechanical loads. In addition, high thermal resistance is required to absorb the stresses of everyday operation.
