  No

Description

The “Finest of Ockenburgh” complex can be found in the Hague, not far from the coast and surrounded by dunes and woodland. This stunning location, nestled in greenery, gives the complex a unique flair. The multiple-occupancy homes were built on the site of former tennis courts. During construction, particular focus was placed on finding sustainable and eco-friendly solutions for the building materials, energy supply and design.

Problem

The building’s structural façade is made from bilinga wood. It needed reliable protection against moisture, blue stain, nesting wasps, mould and algae. The project called for a water-based product that could be applied directly in the plant using pressurised equipment.
